TagFunction or TagKey. Attributes are also stored as strings within the drawing. For example, a user can enter "foo" as the name of an attribute and set the value of the attribute to bar. TagFunctions are a powerful way to control and access the attributes of named objects. For example, the user can enter a "TagFunction" tag into an object such as the tag, and set the value of the tag to a function which takes the attributes of the object as its arguments. A user can then access these attributes by calling the function with the appropriate arguments. Because TagFunctions can be arbitrary functions, the user can, for example, write a TagFunction to return the value of the attribute for a particular object based on its attribute tags. A TagFunction can be an expression or can be based on any of the AutoCAD predefined functions. It is also possible to create custom TagFunctions that can access attributes of objects and write to the drawing. For example, it is possible to write a TagFunction that returns the value of a point of interest's. Attributes of an object are accessed by the tag using the expression "TagValue". The expression that returns the attribute of the named object is "TagFunction(Tag a1d647c40b
