It is frequently used by architects, engineers, illustrators, painters, machine tools, and other professionals who require 2D vector drawing and modeling. There are many alternatives to AutoCAD, such as Adobe Illustrator, Affinity Designer, Adobe Photoshop, Apple's Aperture or iPhoto, CorelDraw, CorelDRAW Graphics Suite, Google SketchUp, Google Earth, Photo Story, 3D Studio Max, Inkscape, Microsoft Illustrator, Adobe Flash (formerly Macromedia Flash), Adobe Premiere, Adobe Animate, open source CAD and BIM applications, etc. The free Open Source CAD / BIM (BIM stands for Building Information Modeling) project OpenCADD is a continuation of the OpenCAD project.[1] The current stable version of AutoCAD is 2019 for Windows and 2019 for Mac OS. The 2019 for Windows version was launched on August 14, 2018, and the 2019 for Mac OS was launched on November 14, 2018. About Autodesk is a company offering many different CAD programs for different professional needs. At the time of writing, all CAD programs are sold as individual licenses which can be purchased for on-line shopping, or bought from authorized resellers. Some CAD programs are also sold as part of a bundle. In the beginning, the software applications were developed in the AutoCAD native format, but the company also worked on the development of third party applications, such as the.dwg import and export format for Autodesk's AutoCAD and other applications. Later it was created the Autodesk 360 platform, allowing to work on the same software package in other applications besides AutoCAD. The Autodesk 360 platform allows to see all features of a document in other applications and to link them to other documents. The development of the software for AutoCAD started in 1982. Autodesk was founded in 1982, and the first version of AutoCAD was released in 1983. Autodesk bought Macromedia, developer of the Flash multimedia application, in 2005, and all applications

Blog 4 Reasons To Protect Your RV So You Won't Get Torn Apart July 28, 2017 Don't you hate when the wind is whipping, your RV isn't pitching and you can feel the inevitable coming? We just finished up our mobile home and over the years, we have accumulated a bunch of knowledge and experience that we are happy to pass along to you for the safe, efficient and cheap operation of your RV. The U.S. Government requires that you carry a fire extinguisher on board and a portable fire extinguisher is best for most situations. The important thing to know about a portable extinguisher is that it is not a go-anywhere-anytime product. It has to be carried to the fire site and it has to be within reach of the fire. Here are the reasons that most of us are wise to carry a portable extinguisher: 1. You're in your RV – there's no one else around to call. If the fire goes off the RV, you're the first one to see it. It can be nasty and the only way to get rid of it is to extinguish it. 2. You're not in your RV and the fire is on a person. You've got to go get help. In this situation, the portable extinguisher is of more use than a permanent appliance. The RV extinguisher must be handled carefully to avoid spraying the extinguisher over a victim or spraying a nearby bystander who might be in danger. 3. You're in your RV and the fire is on a person. You're the first one to arrive. This is a particularly important situation for people who have injuries, are pregnant or suffer from other serious medical conditions. The portable extinguisher can be used to put out fires on your body without risking your life. 4. The portable fire extinguisher comes in a convenient pocket. We've all come home from a busy day and no fire extinguisher is in sight. Just the thought of having to use the one in our RV is enough to send some of us running to get a new one. Add support for CAD layers to the Markup Import and Markup Assist features. In this scenario, you import a PDF that includes CAD layers. Automatically, your drawings are linked to the layers in the PDF so that you can easily perform edits to multiple layers as well as add multiple layer types to your drawings. Version 2023: Zoomed views are available in both workspaces. (Workspace 2 feature, also available in All Drawings mode.) Annotation location is easier to see and easier to place with Dynamic Annotation and new context-sensitive tools. Improved Select feature: Selecting features automatically inserts them into your drawings. Zoomed views are available in both workspaces. Zooming to view a large drawing opens the view from the centimeter setting to the metric setting (1:10,000 scale). This makes the current view more relevant to the amount of detail in your drawing. In the All Drawings mode, all views are always displayed in the 1:10,000 setting. This setting means that you can see all of your drawings at the same level of detail in a single view, regardless of how many of them you have in your drawing. Navigation in the All Drawings mode is optimized for viewing and editing features. You can automatically place any selection tool inside a view for easier editing. You can also duplicate a drawing. Drawings are automatically imported into the All Drawings mode from the Edit tab. When you set an annotation in the current drawing to a text style, the annotation is automatically created with that text style in your All Drawings mode. On-screen guides show you how many units a view is from the 1:10,000 setting. Press Esc to change the magnification setting. Drawings are automatically updated with recent changes when you open or close a drawing. This speeds up the drawing-opening process. Lock view when drawing is closed: Keep drawing views open as you edit your drawing. You can now double-click to select the most recently activated view. You can now configure the Zoom command to open the most recently activated view. You can also use the new keyboard shortcuts to open the most recently activated view. Save drawing history: Save your most recent drawings so you can quickly go back to them. Stay in the same drawing when you open or
