WinFLASHTool is an Open Source tool for writing raw disk images to flash memory cards. .1. Field of the Invention This invention relates to microprocessors and to a method of and apparatus for initializing a microprocessor. 2. Description of the Prior Art Microprocessors such as the Intel 80.times.86 are often provided with a built-in initialization circuit which initially puts all of the components of the microprocessor in a known state. The circuits within the microprocessor are then set to some desired logic state at the time of power up. This initial setting of the microprocessor's internal circuits may be performed, for example, with an internal gate array that is designed to control most of the internal logic of the microprocessor. Typically, the gate array is connected to the input/output ports of the microprocessor so that the internal gates of the gate array are driven by input/output signals. After power-up, the microprocessor is conventionally disabled by maintaining the power supply to the gate array at a low level for a predetermined time period. In other words, the output of the microprocessor is disabled by driving the output of the gate array to a high level during the power-up delay period. The power supply to the input/output ports of the microprocessor, on the other hand, is conventionally maintained at a sufficiently high voltage to enable the input/output pins of the microprocessor to be driven to the appropriate logic state, typically high. There are several problems associated with such a system. For example, with a conventional microprocessor having only a single internal gate array, all of the internal gates of the gate array are toggled by input/output signals during the power-up delay period. This means that a substantial amount of power must be provided to the gate array to perform the initialization function, and the operation of the gate array is typically limited by the size of the power supply to the gate array. The complexity of the initialization operation is also increased because it is necessary to distinguish between when the gates of the gate array are driven to a high level and when they are driven to a low level.Q: Instantiating a new object in Loop Method I have a method that loops through an array of objects. Each object should have an ID and the main method will have an int for a while loop that will assign a value to the ID of each object. When I have the code written like this
