Effect Tools Photoshop has five effect tools: Dodge and Burn, Lens Correction, Replace Color, and Gradient Fill. The dodge and burn tool is used to selectively lighten or darken an area of an image using Adjustments or the History panel. You can use the Dodge and Burn tool to lighten shadows and darken highlights. The Lens Correction tool is an increasingly popular tool that uses computer vision technology to convert a photo to a flattering image. The most common application is to use Lens Correction to repair or eliminate red-eye from photos. To find the Lens Correction tool, choose Enhance⇒Photomerge⇒Lens Correction. Alternatively, select the Lens Correction icon (it's the one with four prisms around it) at the bottom of the Tools panel and press the K key. The Replace Color tool allows you to replace or change colors in an image. You can use the Replace Color tool to change a photo of a red rose to a magenta rose (pink). You can use the tool to add and subtract colors as well as modify the color you're using. Many people find the Gradient Fill tool to be extremely helpful. Whether you're filling an area with a solid color or filling an image with an intense gradient effect, this tool is always effective and easy to use. You can modify your gradient fill from straight to radial and from matte to glossy. If you're just getting started, try the Gradient Drop-Downs. After that, you can select many gradient styles from the Gradient Styles menu. In addition, you can read about the Gradient Draw tool in the following sections.

The octapeptide repeat proteins (ORPs) have been identified as being mutated in patients with spinal and bulbar muscular atrophy (SBMA), which is a motor neuron degenerative disease. The pathogenesis of SBMA is linked to the neurodegeneration of motor neurons in the spinal cord, brainstem, and hypoglossal nerve. Loss of the ORPs and subsequent accumulation of polyglutamine-containing polymers causes the dysfunction and eventual death of motor neurons. We and others have used the SBMA animal model, the rAAV-9, to investigate the mechanisms involved in the loss of these proteins in order to develop effective therapies for the neurodegenerative process of SBMA. We have now found that rAAV-9 expressing ORP-wt4 (rAAV-ORP) can effectively slow the progression of the disease, however, treatment with rAAV-ORP expressing ORP-Δ1-21 (rAAV-ORP-Δ1-21) resulted in a more rapid decline in the animal's ability to move, suggesting a more rapid motor neuron death. This effect was associated with a more rapid loss of another repeat protein, the androgen receptor (AR). Thus, the loss of the AR from motor neurons may be mediated through loss of the ORPs. If so, one could consider the treatment of SBMA patients with AR-specific inhibitors in combination with an ORP-specific gene therapy.Harden tackles Harris, finishes with a double-pump Recommended Video: Though a 12

Badlands of Angola The Badlands of Angola form a relatively dry and arid region of southern Angola. Location and features The Badlands of Angola are located within the Democratic Republic of the Congo at a latitude of −18° 00′S, by about −19° 00′S, but are actually in the south of Angola. The region is located south of Luanda and from Luacano in the province of Cunene. The area is mostly covered by the unglaciated Dona Cristina plateau. It was formed by the Southern African Rift System and is largely populated by Afro-Asiatic tribes, including, the Niauxo, Kinungu and Da-Luah. The region of the Badlands of Angola holds the largest known deposit of diamonds in the world, known as the Pedra Branca District. The deposits are found in a series of parallel faults in the southern part of the DRC in western Angola. Several of these faults run east–west, parallel to the Sanaga River. The diamond fields are within of Angola. In January 2013, DR Congo President Joseph Kabila announced his decision to invite drilling companies to explore for diamonds in the DRC. In December 2013, United States officials said the DRC would be given $90 million to develop the area. List of largest diamond finds On September 10, 2010, after a previous discovery in 2005, a mining company announced that they had found two more significant diamond reserves in this area. One of them, the Krugerrand, is the largest known diamond deposit in the world with, while the other, the Devil's Blue Hole, is the second largest (if incompletely contained) diamond deposit in the world. Because these two mines are too large to control by the Congolese government, they have been placed under the control of a US-led consortium. System Requirements:

Windows 7, 8, 8.1 Intel i3 or equivalent 4 GB RAM "VRAM is a remarkable technology, and has been in development since the early days of computing. It allows graphics designers to build what is essentially a rendering device that can be controlled by the CPU. Without VRAM, the display must be viewed as a standard computer monitor, and the only way to get data on it is through the CPU. Each pixel is stored in a memory cell on the display board, and every data modification to the display is done in the CPU.
