

There are so many things to do in Photoshop. To help you in your pursuit of Photoshop, here are some Photoshop tips. All you need to do to install Adobe Photoshop is first go to the Adobe website and click on the download button. Once you have downloaded the file, make sure that it's named correctly. Then, double click on the file, and you should be able to open the file. After you complete the setup, you should be able to see all of the tools and features that you will need in Adobe Photoshop.

I know it does not seem immediately obvious, but working on a project that I've already edited in Lightroom 4.3, I noticed that the conversion of a new master image was taking about half as long as before. In Lightroom 5 though, the conversion time has doubled. This makes me wonder how they did the benchmarking. Lightroom 5's processing functions seem more integrated with the image preview. I'm also not too sure if there are any other side effects from this integration — maybe it's rendering more expensive for Lightroom 5 to do things and it's only I'm noticing it now, but I believe I'll be keeping Lightroom 4 for a little longer. I'm just trying out the new version on a project I've just brought home from the beach. I plan to dump the original raw's via Lightroom in order to speed up the conversion process. It's a nice to have feature, but in all honesty I forgot about it. I typically use the original raw's unless I'm working on a spot in a photo that I want to change, but my work is done by this point in the day and I've had some sleep, so I've gone with the stunted image quality for now to see if the new version is worth the hassle of using at work. If nothing else, I will definitely keep this software around. If this is the direction we're going with the Photoshop family, I'll be all over it! The "Smart Preview" feature is great when you don't have Photoshop, or when the machine you are editing on you are weak. However, there's some small, easily overlooked drawbacks in the "Smart Preview" feature. For instance, the "Smart Preview" feature is in the way while you are working

on a "normal" image. Like LR4, you can choose to turn the "Smart Preview" feature off, but how do you go back to working on a "normal" image? While you can (and probably should) turn the "Smart Preview" feature off, there's something only Photoshop can do that I wish Lightroom or NIK's DPP could do. I find myself choosing "Normal" over "Smart Preview" more often than I should. Also, when you enable the "Smart Preview" feature, the "DNG preview for the DNG file you are working on" does not show, even though other "DNG previews" show.
